

# SolarZone Maintenance Recommendations

Thank you for purchasing SolarZone window films. We are certain you will be pleased with your decision! The information below will help keep the film looking great for years to come.

## After installation

Your window film was applied using a special solution of detergent and water, followed by squeegeeing to remove the excess water. However, the drying process is still continuing, and it will take several days or weeks to complete, depending on local weather conditions. In the meantime, the window may appear a bit foggy, it is no cause for alarm. If local bubbles appear, do not try to remove them by popping or pressing them. In time, the adhesive will complete its bonding process, and the moisture will disappear, leaving the windows perfectly clear.

If after several weeks, the window still appears foggy, please contact your installation company.

## Cleaning Instructions

- Although all Hanita's films have excellent scratch resistance, it is preferable not to use abrasive products.
- Use soapy water or an alcohol based cleaner with a soft cloth.

### Take care!

Please don't clean your windows for 30 days

Use fresh, soft material to wash and dry the window film surface.

Don't use harsh Ammonia based cleaners! Wash the window with mild solutions of liquid detergent and water.

Use of a vapor cleaner is not recommended.

Please keep these instructions handy, and show them to your window cleaner.
